## Overview

The DS6R plugs into the BP2, BP4 or BP8 backplane. The DS6R monitors six dry switch closure devices and provides one resistive output to the controller. Each switch closure subtracts a precise resistance from the output so a simple subtraction algorithm decodes which switches are set. Each switch terminates on an independent plug on the front of the module and an LED associated with each input indicates switch closure for simple troubleshooting.

## Mounting

The DS6R plugs into either a BP2, BP4 or BP8 board as shown in figure 1 .

Figure 1:
DS6R plugging into a BP4 Backplane

## Termination

The switch inputs that the DS6R monitors are dry contacts isolated from other circuits. The switch circuits on the DS6R module provide 10 mA sealing current at an open circuit voltage of 5 VDC. Carefully check the specifications on the external switches for proper operation at these sealing current levels.

## PIN NUMBERS

Switch input 1 ....................... 13, 14
Switch input 2 ....................... 11, 12
Switch input 3 .......................9, 10
Switch input 4 ....................... 7, 8
Switch input 5 .......................5, 6
Switch input 6 .......................3, 4
Analog output resistance ...... 1 - ouput resistance 2 - ground

Note: The male connectors that plug into the jacks on the board use a rising block screw terminal to hold the wires. It is possible for the block to be in a partially up position allowing the wire to be inserted under the block. Be sure that the male connector screws are turned fully counterclockwise before inserting the wire. Lightly tug on each wire after tightening to verify proper termination.

Specifications subject to change without notice.

## operation

Each switch input has an LED associated with it. When the switch is closed the LED will light. The LEDs are physically mounted to correspond with the connector location for that input.

Each switch closure subtracts a precise resistance from the total output resistance of $29.505 \mathrm{~K} \Omega$ as shown in Table 1 at right and in the chart on page 3.

As indicated in the chart, if switches 1,2 and 5 are closed, the output resistance is $29.505 \mathrm{~K} \Omega-15 \mathrm{~K} \Omega-7.5 \mathrm{~K} \Omega-931 \Omega=6.074 \mathrm{~K} \Omega$.

Note: Output resistors are 1/4 watt, be sure that your controller does not overpower them.

| Table 1: Output Resistance |  |
| :---: | :---: |
| Circuit | Subtraction from <br> Output Resistance |
| 1 | $15 \mathrm{~K} \Omega( \pm 1 \%)$ |
| 2 | $7.5 \mathrm{~K} \Omega( \pm 1 \%)$ |
| 3 | $3.74 \mathrm{~K} \Omega( \pm 1 \%)$ |
| 4 | $1.87 \mathrm{~K} \Omega( \pm 1 \%)$ |
| 5 | $931 \Omega( \pm 1 \%)$ |
| 6 | $464 \Omega( \pm 1 \%)$ |

## Decoding

The following algorithm in the controller will determine which of the five switches are closed or open. The variable name of Rin used in the following example may be any name that makes sense in your code.

Step 1. Read the resistance from the analog input, save as a variable called Rin.
Step 2. Is the value of Rin between 0 and 30980
Yes.....Go to Step 3
No.......Go to Step 9 (END)
Step 3. Is the value of $\operatorname{Rin}<14750$
Yes.....Switch 1 = Closed or On. Rin2 = Rin. Go to Step 4.
No......Switch $1=$ Open or Off. $\quad$ Rin2 $=$ Rin -15000
Step 4. Is the value of $\operatorname{Rin} 2<7250$
Yes.....Switch 2 = Closed or On. Rin3 = Rin2. Go to Step 5.
No......Switch 2 = Open or Off. Rin3 = Rin2-7500
Step 5. Is the value of Rin3 < 3515
Yes.....Switch $3=$ Closed or On. Rin4 $=$ Rin3. Go to Step 6.
No......Switch 3 = Open or Off. $\quad$ Rin4 $=$ Rin3-3740
Step 6. Is the value of Rin4 < 1645
Yes.....Switch $4=$ Closed or On. Rin5 = Rin4. Go to Step 7.
No......Switch $4=$ Open or Off. $\quad \operatorname{Rin5}=\operatorname{Rin} 4-1870$
Step 7. Is the value of Rin5 $<714$
Yes.....Switch $5=$ Closed or On. Rin6 $=$ Rin5. Go to Step8.
No......Switch $5=$ Open or Off. $\quad$ Rin6 $=$ Rin5-931
Step 8. Is the value of Rin6 < 250
Yes.....Switch $6=$ Closed or On
No......Switch $6=$ Open or Off
Step 9. END

This table defines the output resistances for the BAPI BA/DS6R. The resistance outputs have been changed into equivalent temperatures for the $10 \mathrm{~K}-2$ and 10K-3 thermistors. The resistors that define the output resistance are precision units with $\pm 1 \%$ uncertainties. Temperature accuracies are $\pm 0.4^{\circ} \mathrm{F}\left( \pm 0.22^{\circ} \mathrm{C}\right)$ at the low equivalent temperature and $\pm 0.7^{\circ} \mathrm{F}\left( \pm 0.39^{\circ} \mathrm{C}\right)$ at the high equivalent temperatures.
BAPI does not warranty the suitability of these outputs for your particular application. After connecting the BA/DS6R to your controller be sure to test all switch combinations for proper decoding.

## Troubleshooting

POSSIBLE PROBLEMS:
Power LED D2 does not light

Improper output resistance

Switch LED does not light when switch is closed

## POSSIBLE SOLUTIONS:

- Check to see that the DS6R is firmly inserted into the backplane
- Check to see if the power cable is firmly inserted into the backplane.
- Check to see if the power supply is turned on and working correctly
- Check to see if the output connector is plugged into the correct position.
- Recheck which LEDs are on, and recalculate the expected output resistance.
- Check to see if the switch connector is plugged into the correct position.
- Check switch for proper operation
- Remove switch wiring from connector and replace with a shorted plug, LED should light.

## Speciffcations

Power Voltage
10 to 42 VDC
20 to 26 VAC
Power Current 70 mA maximum DC 2.4 VA maximum AC

Switch Voltage 5 VDC

Switch Current 10 mA
Output Resistance $\qquad$ Less than $30 \Omega$ (All switches closed) $29.505 \mathrm{~K} \Omega$ (All switches open)

Note: the DS6R may be powered by the BAPI VC75, VC100, VC350, VC2700-STM, PS17 or PS17CB. Contact your BAPI representative for details.
